CMPT 120 Standard Final Exam Sample 1 Multiple Choice Questions

Duration	1 nour
Aids allowed	No notes, no papers, no books, no computers, no calculators, etc.
Scoring	For each question fill in the one best answer on the answer sheet. Correct answers are worth 1 point. Incorrect answers, multiple answers, illegible answers,
During the	or unanswered questions are worth 0 points. Raise your hand if you have a question and remain seated. We will come to you. Questions about exam/course content will not be answered during the exam.

- A. 11
- B. 14
- C. 344
- D. 3434
- E. nothing is printed: the statement has an error
- 2) Consider this code fragment:

$$a = 2.5$$

$$b = 3.2$$

$$a = b + a$$

$$b = a + b$$

- print(b)
- i) The printed value of a is 5.7
- ii) The printed value of b is 8.9
- A. i) and ii) are both true
- B. i) and ii) are both false
- C. i) is true and ii) is false
- D. i) is false and ii) is true

3) Consider this code fragment:

```
a = 2
b = 7
???
print(a) # 7
print(b) # 2
```

Suppose ??? is replaced by one of the fragments below. Which one makes the code print 7 for a and 2 for b?

```
A.

a = a - b

b = b + a

a = a - b

B.

t = a

a = b

b = t

C.

t = b

a = b

b = t

D. all of A, B, and C

E. none of A, B, or C
```

4) Consider this statement:

Consider these 4 operators: +, *, **, %

How many of the operators can replace ??? so that the statement prints 4?

- A. 0 of the operators
- B. 1 of the operators
- C. 2 of the operators
- D. 3 of the operators
- E. 4 of the operators

5) Consider these statements:

- i) Python strings can be modified
- ii) Python lists can be modified
- A. i) and ii) are both true
- B. i) and ii) are both false
- C. i) is true and ii) is false
- D. i) is false and ii) is true

6) What does this print?

- A. 2
- B. 0
- C. -1
- D. 1

E. nothing is printed: there is an array indexing error

7) What does this print?

$$S = [2, 1, 3]$$

$$T = S$$

$$S[2] = 0$$

print(T)

- B. [2, 1, 0]
- C. [2, 0, 3]
- D. [0, 1, 3]

8) Consider this code:

Which statement prints zar?

- A. print(s[2:4])
- B. print(s[2:5])
- C. print(s[3:5])
- D. print(s[3:6])

- 9) Consider these statements:
 - i) There can be duplicates in the keys of a dictionary.
 - ii) There can be duplicates in the values of a dictionary.
 - A. i) and ii) are both true
 - B. i) and ii) are both false
 - C. i) is true and ii) is false
 - D. i) is false and ii) is true
- 10) How many of these three programs print 6?

```
# program 1
                            # program 2
                                                        # program 3
d = \{'a':1, 'b':2, 'c':3\}
                            d = \{'a':1, 'b':2, 'c':3\}
                                                        d = \{'a':1, 'b':2, 'c':3\}
total = 0
                            total = 0
                                                        total = 0
for x in d:
                            for x in d:
                                                        for x in range(len(d)):
    total += x
                                total += d[x]
                                                             total += d[x]
print(total)
                            print(total)
                                                         print(total)
```

- A. 0
- B. 1
- C. 2
- D. 3
- 11) What does this program print if the user enters house for a and mouse for b?

```
a = input('a? ')
b = input('b? ')
if not (len(a) != len(b)):
    print('yes')
if len(a) == len(b):
    print('no')
print('done')
A.
      done
В.
      yes
      done
C.
      no
      done
D.
      yes
```

no done 12) Assuming both a and b are strings, which code fragment prints 'good' exactly when a and b are different strings of the same length?

```
A.
      if len(a) == len(b) and a != b:
           print('good')
      else:
           print('bad')
B.
      if len(a) == len(b) or a != b:
           print('good')
      else:
           print('bad')
C.
      if not (len(a) == len(b)) and a == b):
           print('good')
      else:
           print('bad')
D.
      if not (len(a) == len(b) \text{ or } a == b):
           print('good')
      else:
           print('bad')
```

13) What values of a and b make this code print 2?

```
if a < 0 or b < 0:
        print(a)
    elif a < b < 0:
        print(b)
    else:
        print(a + b)

A. a is 2, b is 2
B. a is 2, b is -1
C. a is -1, b is 2
D. a is -1, b is -1
E. there are no values of a and b that make the code print 2</pre>
```

14) What function call returns the same value as f('4')? def f(c): result = 0if c in '0123456789': if c in '01': result += int(c) if c in '02468': result += int(c) else: result += int(c) - 1 else: result = -1return result A. f('2') B. f('3')

C. f('5')

D. f('6')

E. none of the above return the same value as f('4')

15) If variables a and b are both strings, what are the possible values of this expression?

$$(a == b) and (a != b)$$

A. it always evaluates to True

B. it always evaluates to False

C. depending upon the values of a and b, sometimes it evaluates to True, and sometimes it evaluates to False

16) What does this print?

```
x = 2
result = 0
for i in range(5):
    if i > 2:
       result += i
print(result)
A. 7
```

B. 10

C. 12

D. 15

```
17) What does this print?
    s = 'grads'
    result = ''
    for i in s:
         if i < 'k':
             result += i
    print(result)
    A. nothing is printed because the final value of result is the empty string
    C. gad
    D. the program crashes when i < k' is evaluated
18) What does this print?
    lst = [4, 0, 9, 1]
    result = 0
    for i in range(len(lst)):
         result += i + lst[i]
    print(result)
    A. 6
    B. 14
    C. 20
    D. an int other than 6, 14, or 20
19) What does this print?
    result = 'start'
    for i in ['up', 'moose', 'elephant', '!']:
         if len(i) > len(result):
              result = i
    print(result)
    A. start
    B. up
    C.\ moose
    D. elephant
    E. !
```

```
20) What does this print?

result = 0
for i in range(5):
    for j in range(1, 4):
        result += 1
print(result)

A. 8
```

- B. 9
- C. 15
- D. 20
- E. an int other than 8, 9, 15, or 20
- 21) What does this print?

- A. 14
- B. 20
- C. 30
- D. an int other than 14, 20, or 30
- E. it doesn't print an int
- 22) What does this print?

- A. 0
- B. 1
- C. 2
- D. 4
- E. 5

23) What does this print? s = 'apple' i = 0result = '' while i < len(s): if s[i] == s[i + 1]: result += s[i] i += 1 print(result) A. p B. pp C. ale D. nothing: the final value of result is the empty string E. nothing: the program crashes when it runs 24) What does this print? s = 'mysterious' i = 0flag = False while not flag: if s[i] in 'aeiou': flag = True i += 2 else: i += 1print(s[i]) A. e B.i C. o D.r E. nothing: the program loops forever and never reaches the print statement

```
n = 64
    while n > 1:
        n = n / 2
    print(n)
A. 0.0
```

B. 0.5

C. 1.0

D. 2.0

E. nothing: the program loops forever and never reaches the print statement

This is **Code Listing 1**, referred to in the next few question:

```
def print_n(s, n):
                       # line 1
   for i in range(n): # line 2
       print(s)
                      # line 3
def f(n):
                       # line 4
   if n % 2 == 0: # line 5
                                       Code Listing 1
       return n / 2  # line 6
                        # line 7
   else:
       return 3 * n + 1 # line 8
def main():
   a = 3
                       # line 9
   b = int(f(a + 1)) # line 10
   print n('hello', b) # line 11
```

- 26) In Code Listing 1, when main() is called, 'hello' is printed twice.
 - A. True
 - B. False
- 27) In Code Listing 1, main has two local variables.
 - A. True
 - B. False
- 28) In Code Listing 1, if line 9 is changed to a = 5, then the program prints 'hello' 4 times.
 - A. True
 - B. False
- 29) In Code Listing 1, int(f(f(50))) evaluates to 76.
 - A. True
 - B. False

- 30) In Code Listing 1, if line 2 was changed to for i in range(1, n+1), then the program would print the same thing as if the change was not made.
 - A. True
 - B. False
- 31) In Code Listing 1, if function main() was moved to be defined before function print_n(), the program would print the same thing as if the change was not made.
 - A. True
 - B. False
- 32) In Code Listing 1, if lines 9, 10, and 11 had their indent removed so that they each started in the same column as the d in def on line 4, then calling main() would print 'hello' twice.
 - A. True
 - B. False
- 33) Consider this code:

```
def reset(n):
    n = 0

def test1(x):
    x = 1
    reset(x)
    print(x)

def test2():
    n = 1
    reset(n)
    print(n)
```

- i) Calling test1() prints 0.
- ii) Calling test2() prints 0.
- A. i) and ii) are both true
- B. i) and ii) are both false
- C. i) is true and ii) is false
- D. i) is false and ii) is true

- 34) Suppose we want a function that takes a string s as input and returns a string as follows:
 - If s *ends* with a newline character, then the returned string is the same as s except that the one newline at the end has been removed.
 - If s does not end with a newline character, then the returned string is the same as s.

Here are two possible implementations of this function:

```
def chop1(s):
    if s == '':
        return s
    elif s[-1] == '\n':
        return s[:-1]
    else:
        return s
    return s
```

- A. both are **correct** implementations
- B. both are **incorrect** implementations
- C. chop1 is a correct implementation, and chop2 is an incorrect implementation
- D. chop1 is an incorrect implementation, and chop2 is a incorrect implementation
- 35) Suppose this line of code correctly opens the non-empty text file named data.txt:

```
f = open('data.txt')
```

How can you print the **first** line of data.txt?

```
A. print(f[0])
B. print(f.read())
C. print(f.readline())
D. all of the above
```

36) Suppose this line of code correctly opens the text file named data.txt:

```
f = open('data.txt')
```

Which statement prints the total number of characters in data.txt?

```
A. print(f)
B. print(len(f))
C. print(f.read())
D. print(len(f.read()))
```

37) Suppose this line of code correctly opens the text file named data.txt:

```
f = open('data.txt')A. f is open just for readingB. f is open just for writingC. f is open for both reading and writing
```

38) Which function returns the index location of an int x in a list 1st?

```
def linear_search1(x, lst):
    for i in range(len(lst) - 1):
        if lst[i] == x:
            return i
    return -1
B.
def linear_search2(x, lst):
    i = 0
    while i < len(lst):
        if lst[i] == x:
            return i
        i += 1
        return -1
C.
def linear_search3(x, lst):
    for i in 1st:
        if i == x:
            return i
    return -1
D.
def linear_search4(x, lst):
    i = 0
    while i < len(lst):
        if lst[i] == x:
            return i
        i += 1
    return -1
```

```
def f(lst, target):
    for i in range(len(lst)):
        if lst[i] + 5 == target:
            return i
    return -1

data = [10, 3, 6, 5, 2, 7]
print(f(data, 6))

A.-1
B. 2
C. 5
D. 6
E. an int other than -1, 2, 5, or 6
```

40) Here are two possible implementations of a function that is meant to return the sum of the numbers in a list of numbers:

```
def sum1(lst):
    for n in lst:
        result += n
    return result

        result += lst[i]
        return result
```

- A. both are **correct** implementations
- B. both are **incorrect** implementations
- C. sum1 is a correct implementation, and sum2 is an incorrect implementation
- D. sum1 is an incorrect implementation, and sum2 is a incorrect implementation
- 41) What does this print?

A. 1

B. 4

C. 11

D. 15

E. an int other than 1, 4, 11, or 15

42) What value of x makes this program print 4?

```
lst = [2, x, 1, 1, 3, 1, 3]
print(lst.count(lst[1])) # prints 4
```

- A. 0
- B. 1
- C. 2
- D. 3

E. an int other than 0, 1, 2, or 3

43) What does this print?

- A. 0
- B. 1
- C. 2
- D. 3

E. an int other than 0, 1, 2, or 3

44) If you run binary search on this list, what is the first value the search checks?

- A. 4
- B. 9
- C. 10
- D. 11

E. an int other than 4, 9, 10, or 11

- 45) Consider these statements:
 - i) Linear search requires that the data it is searching be in sorted order.
 - ii) Binary search requires that the data it is searching be in sorted order.
 - A. i) and ii) are both true
 - B. i) and ii) are both false
 - C. i) is true and ii) is false
 - D. i) is false and ii) is true

	A. n B. $2n$ C. n^2 D. n^3 E. 2^n
47)	In the worst case, about how many comparisons must be done to test if a list of n ints is in ascending sorted order?
	A. n B. $2n$ C. n^2 D. n^3 E. 2^n
48)	What does this print?
	<pre>count = 0 for i in range(10): if i % 2 == 0: count += 1 print(count)</pre>
	A. 5 B. 6 C. 9 D. 10 E. an int other than 5, 6, 9, or 10
49)	<pre>What does this print? count = 0 for i in range(10): for j in range(15): count += 1 print(count)</pre>
	A. 23 B. 25 C. 126 D. 150 E. an int other than 23, 25, 126, or 150

46) In the worst case, about how many comparisons does **selection sort** do to sort a list of n ints?

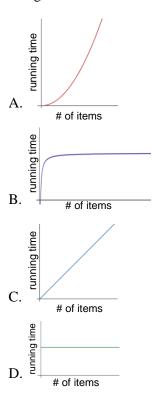

```
count = 0
for i in range(5):
    for j in range(5):
        if i != j:
        count += 1
print(count)

A. 5
B. 12
C. 20
D. 25
```

E. an int other than 5, 12, 20, or 25

Algorithm performance measurement: graphs, sorting, running time

51) Which graph best describes the worst-case running-time of the selection sort algorithm? For each graph, the vertical y-axis is running time, and the horizontal x-axis is the number of items being sorted.

- 52) What is a recursive function?
 - A. a function that is called multiple times by other functions
 - B. a function that has no loops
 - C. a function that calls itself
 - D. a function that calls itself, and does not call any other functions
- 53) Consider these statements:
 - i) Any recursive can be re-written as an equivalent function that doesn't use recursion.
 - ii) Any function that uses loops can be re-written as an equivalent function (or functions) that uses recursion instead of loops.
 - A. i) and ii) are both true
 - B. i) and ii) are both false
 - C. i) is true and ii) is false
 - D. i) is false and ii) is true
- 54) What does this print?

E. none of the above

```
def g(n):
    if n <= 0:
        return 0
    else:
        return g(n - 2) + n

print(g(5))

A. 9
B. 10
C. 13
D. 15</pre>
```

```
def h(n):
    if n == 0:
        return 0
    else:
        return h(n - 1)

print(h(1000))

A. 0
B. 1
C. 999
D. 1000
E. none of the above
```

- 56) Who was the original creator of Python?
 - A. Guido van Rossum
 - B. Dennis Ritchie
 - C. James Gosling
 - D. Brendan Eich
- 57) Which application is **NOT** a good fit for Python?
 - A. data science, e.g. processing and displaying data
 - B. machine learning scripting, e.g. processing data and running learning algorithms
 - C. high-performance real-time systems, such as airplane control software
 - D. back-end web development
- 58) What does this print?

- A. -1
- B. -2
- C. 1
- D. 2

D. the code prints nothing due to an error

60) What does this print?

D. the code prints something, but none of the above

E. the code prints nothing due to an error
