# CMPT 120 Standard Final Exam Sample 1 Multiple Choice Questions

Duration	1 nour
Aids allowed	No notes, no papers, no books, no computers, no calculators, etc.
Scoring	For each question fill in <b>the one best answer</b> on the answer sheet.  Correct answers are worth 1 point. Incorrect answers, multiple answers, illegible answers,
During the	or unanswered questions are worth 0 points.  Raise your hand if you have a question and remain seated. We will come to you. Questions about exam/course content will <b>not</b> be answered during the exam.

- A. 11
- B. 14
- C. 344
- D. 3434
- E. nothing is printed: the statement has an error
- 2) Consider this code fragment:

$$a = 2.5$$

$$b = 3.2$$

$$a = b + a$$

$$b = a + b$$

- print(b)
- i) The printed value of a is 5.7
- ii) The printed value of b is 8.9
- A. i) and ii) are both true
- B. i) and ii) are both false
- C. i) is true and ii) is false
- D. i) is false and ii) is true

3) Consider this code fragment:

Suppose ??? is replaced by one of the fragments below. Which one makes the code print 7 for a and 2 for b?

```
A.

a = a - b

b = b + a

a = a - b

B.

t = a

a = b

b = t

C.

t = b

a = b

b = t

D. all of A, B, and C

E. none of A, B, or C
```

4) Consider this statement:

How many of these 4 operators can replace ??? so that the statement prints 4?

- + \* \*\* %
- A. 0 of the operators
- B. 1 of the operators
- C. 2 of the operators
- D. 3 of the operators
- E. 4 of the operators

### 5) Consider these statements:

- i) Python strings can be modified
- ii) Python lists can be modified
- A. i) and ii) are both true
- B. i) and ii) are both false
- C. i) is true and ii) is false
- D. i) is false and ii) is true
- 6) What does this print?

- A. 2
- B. 0
- C. -1
- D. 1

E. nothing is printed: there is an indexing error

7) What does this print?

$$S = [2, 1, 3]$$

$$T = S$$

$$S[2] = 0$$

print(T)

- A. [2, 1, 3]
- B. [2, 1, 0]
- C. [2, 0, 3]
- D. [0, 1, 3]
- 8) Consider this code:

Which statement prints zar?

- A. print(s[2:4])
- B. print(s[2:5])
- C. print(s[3:5])
- D. print(s[3:6])

- 9) Consider these statements:
  - i) A dictionary can have duplicate keys.
  - ii) A dictionary can have duplicate values.
  - A. i) and ii) are both true
  - B. i) and ii) are both false
  - C. i) is true and ii) is false
  - D. i) is false and ii) is true
- 10) How many of these three programs print 6?

```
# program 1
                            # program 2
                                                        # program 3
d = \{'a':1, 'b':2, 'c':3\}
                            d = \{'a':1, 'b':2, 'c':3\}
                                                        d = \{'a':1, 'b':2, 'c':3\}
total = 0
                            total = 0
                                                        total = 0
for x in d:
                            for x in d:
                                                        for x in range(len(d)):
    total += x
                                total += d[x]
                                                             total += d[x]
print(total)
                            print(total)
                                                         print(total)
```

- A. 0
- B. 1
- C. 2
- D. 3
- 11) What does this program print if the user enters house for a and mouse for b?

```
a = input('a? ')
b = input('b? ')
if not (len(a) != len(b)):
    print('yes')
if len(a) == len(b):
    print('no')
print('done')
A.
      done
В.
      yes
      done
C.
      no
      done
D.
      yes
```

no done 12) Suppose a and b are non-empty strings of the same length, and there's a character in a that's not in b. Which code fragment prints 'bad'?

```
A.
      if len(a) == len(b) and a != b:
           print('good')
      else:
          print('bad')
B.
      if len(a) == len(b) or a != b:
          print('good')
      else:
           print('bad')
C.
      if not (len(a) == len(b)) and a == b):
           print('good')
      else:
           print('bad')
D.
      if not (len(a) == len(b) \text{ or } a == b):
          print('good')
      else:
          print('bad')
```

13) What values of a and b make this code print 2?

```
if a < 0 or b < 0:
        print(a)
    elif a < b < 0:
        print(b)
    else:
        print(a + b)

A. a is 2, b is 2
B. a is 2, b is -1
C. a is -1, b is 2
D. a is -1, b is -1
E. none of the above values of a and b make the code print 2</pre>
```

14) What function call returns the same value as f('4')?

def f(c):
 result = 0
 if c in '0123456789':
 if c in '01':
 result += int(c)
 if c in '02468':
 result += int(c)
 else:
 result += int(c) - 1
 else:
 result = -1

 return result

A. f('2')
 B. f('3')

C. f('5')

D. f('6')

E. none of the above return the same value as f('4')

15) If variables a and b are both strings, what are the possible values of this expression?

$$(a == b) and (a != b)$$

A. it always evaluates to True

B. it always evaluates to False

C. depending upon the values of a and b, sometimes it evaluates to True, and sometimes it evaluates to False

16) What does this print?

```
x = 2
result = 0
for i in range(5):
    if i > 2:
        result += i
print(result)
```

A. 7

B. 10

C. 12

D. 15

```
17) What does this print?
    s = 'grads'
    result = ''
    for i in s:
         if i < 'k':
             result += i
    print(result)
    A. nothing is printed because the final value of result is the empty string
    C. gad
    D. the program crashes when i < k' is evaluated
18) What does this print?
    lst = [4, 0, 9, 1]
    result = 0
    for i in range(len(lst)):
         result += i + lst[i]
    print(result)
    A. 6
    B. 14
    C. 20
    D. an int other than 6, 14, or 20
19) What does this print?
    result = 'start'
    for i in ['up', 'moose', 'elephant', '!']:
         if len(i) > len(result):
              result = i
    print(result)
    A. start
    B. up
    C.\ moose
    D. elephant
    E. !
```

```
20) What does this print?
     result = 0
     for i in range(5):
          for j in range(1, 4):
              result += 1
     print(result)
     A. 8
     B. 9
     C. 15
     D. 20
     E. an int other than 8, 9, 15, or 20
21) What does this print?
     result = 0
     i = 6
     while i < 10:
          result += i
          i += 2
     print(result)
     A. 14
     B. 20
     C. 30
     D. an int other than 14, 20, or 30
     E. nothing: it doesn't print an int
22) What does this print?
     i = 4
     result = -1
     while i >= 0:
          if (i + 1) \% 2 == 0:
              result = i
          i += -1
     print(result)
     A. 0
     B. 1
     C. 2
     D. 4
     E. 5
```

23) What does this print? s = 'apple' i = 0result = '' while i < len(s): if s[i] == s[i + 1]: result += s[i] i += 1 print(result) A. p B. pp C. ale D. nothing: the final value of result is the empty string E. nothing: the program crashes when it runs 24) What does this print? s = 'mysterious' i = 0flag = False while not flag: if s[i] in 'aeiou': flag = True i += 2 else: i += 1print(s[i]) A. e B.i C. o D.r E. nothing: the program loops forever and never reaches the print statement

```
n = 64
    while n > 1:
        n = n / 2
    print(n)
A. 0.0
```

B. 0.5 C. 1.0

D. 2.0

E. nothing: the program loops forever and never reaches the print statement

This is **Code Listing 1**, referred to in the next few question:

```
def print_n(s, n):
                       # line 1
   for i in range(n): # line 2
       print(s)
                      # line 3
def f(n):
                       # line 4
   if n % 2 == 0: # line 5
                                       Code Listing 1
       return n / 2  # line 6
                        # line 7
   else:
       return 3 * n + 1 # line 8
def main():
   a = 3
                       # line 9
   b = int(f(a + 1)) # line 10
   print n('hello', b) # line 11
```

- 26) In Code Listing 1, when main() is called, 'hello' is printed twice.
  - A. True
  - B. False
- 27) In Code Listing 1, main has two local variables.
  - A. True
  - B. False
- 28) In Code Listing 1, if line 9 is changed to a = 5, then the program prints 'hello' 4 times.
  - A. True
  - B. False
- 29) In Code Listing 1, int(f(f(50))) evaluates to 76.
  - A. True
  - B. False

- 30) In Code Listing 1, if line 2 was changed to for i in range(1, n+1), then the program would print the same thing as if the change was not made.
  - A. True
  - B. False
- 31) In Code Listing 1, if function main() was moved to be defined before function print\_n(), the program would print the same thing as if the change was not made.
  - A. True
  - B. False
- 32) In Code Listing 1, if lines 9, 10, and 11 had their indent removed so that they each started in the same column as the d in def on line 4, then calling main() would print 'hello' twice.
  - A. True
  - B. False
- 33) Consider this code:

```
def reset(n):
    n = 0

def test1(x):
    x = 1
    reset(x)
    print(x)

def test2():
    n = 1
    reset(n)
    print(n)
```

- i) Calling test1(0) prints 0.
- ii) Calling test2() prints 0.
- A. i) and ii) are both true
- B. i) and ii) are both false
- C. i) is true and ii) is false
- D. i) is false and ii) is true

- 34) Suppose we want a function that takes a string s as input and returns a string as follows:
  - If s *ends* with a newline character, then the returned string is the same as s except that the one newline at the end has been removed.
  - If s does not end with a newline character, then the returned string is the same as s.

Here are two possible implementations of this function:

```
def chop1(s):
    if s == '':
        return s
    elif s[-1] == '\n':
        return s[:-1]
    else:
        return s
    return s
```

- A. both are **correct** implementations
- B. both are **incorrect** implementations
- C. chop1 is a correct implementation, and chop2 is an incorrect implementation
- D. chop1 is an **incorrect** implementation, and chop2 is a **correct** implementation
- 35) Suppose this line of code correctly opens the non-empty text file named data.txt:

```
f = open('data.txt')
```

How can you print just the **first** line of data.txt?

```
A. print(f[0])
B. print(f.read())
C. print(f.readline())
D. all of the above
```

36) Suppose this line of code correctly opens the text file named data.txt:

```
f = open('data.txt')
```

Which statement prints the total number of characters in data.txt?

```
A. print(f)
B. print(len(f))
C. print(f.read())
D. print(len(f.read()))
```

37) Suppose this line of code correctly opens the text file named data.txt:

```
f = open('data.txt')A. f is open just for readingB. f is open just for writingC. f is open for both reading and writing
```

38) Which function returns the index location of an int x in a list 1st?

```
def linear_search1(x, lst):
    for i in range(len(lst) - 1):
        if lst[i] == x:
            return i
    return -1
B.
def linear_search2(x, lst):
    i = 0
    while i < len(lst):
        if lst[i] == x:
            return i
        i += 1
        return -1
C.
def linear_search3(x, lst):
    for i in 1st:
        if i == x:
            return i
    return -1
D.
def linear_search4(x, lst):
    i = 0
    while i < len(lst):
        if lst[i] == x:
            return i
        i += 1
    return -1
```

```
def f(lst, target):
    for i in range(len(lst)):
        if lst[i] + 5 == target:
            return i
    return -1

data = [10, 3, 6, 5, 2, 7]
print(f(data, 6))

A.-1
B.2
C.5
D.6
E. an int other than -1, 2, 5, or 6
```

40) Here are two possible implementations of a function that is meant to return the sum of the numbers in a list of numbers:

- A. both are **correct** implementations
- B. both are **incorrect** implementations
- C. sum1 is a correct implementation, and sum2 is an incorrect implementation
- D. sum1 is an incorrect implementation, and sum2 is a correct implementation
- 41) What does this print?

42) What value of x makes this program print 4?

```
lst = [2, x, 1, 1, 3, 1, 3]
print(lst.count(lst[1])) # prints 4
```

- A. 0
- B. 1
- C. 2
- D. 3

E. an **int** other than 0, 1, 2, or 3

43) What does this print?

- A. 0
- B. 1
- C. 2
- D. 3

E. an int other than 0, 1, 2, or 3

44) If you run binary search on this list, what is the first value the search compares to the target?

- A. 4
- B. 9
- C. 10
- D. 11

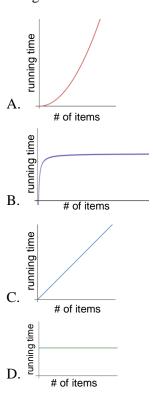

E. an int other than 4, 9, 10, or 11

- 45) Consider these statements:
  - i) Linear search requires that the data it is searching be in sorted order.
  - ii) Binary search requires that the data it is searching be in sorted order.
  - A. i) and ii) are both true
  - B. i) and ii) are both false
  - C. i) is true and ii) is false
  - D. i) is false and ii) is true

46)	In the worst case, about how many comparisons does <b>selection sort</b> do to sort a list of $n$ ints?
	A. $n$ B. $2n$ C. $n^2$ D. $n^3$ E. $2^n$
47)	In the worst case, about how many comparisons must be done to test if a list of $n$ ints is in ascending sorted order?
	A. $n$ B. $2n$ C. $n^2$ D. $n^3$ E. $2^n$
48)	What does this print?
	<pre>count = 0 for i in range(10):     if i % 2 == 0:         count += 1 print(count)  A. 5 B. 6 C. 9 D. 10 E. an int other than 5, 6, 9, or 10</pre>
49)	What does this print?
	<pre>count = 0 for i in range(10):     for j in range(15):         count += 1 print(count)</pre>
	A. 23 B. 25 C. 126 D. 150 E. an int other than 23, 25, 126, or 150

E. an int other than 5, 12, 20, or 25

51) Which graph best describes the worst-case running-time of the selection sort algorithm? For each graph, the vertical y-axis is running time, and the horizontal x-axis is the number of items being sorted.

- 52) What is a recursive function?
  - A. a function that is called multiple times by other functions
  - B. a function that has no loops
  - C. a function that calls itself
  - D. a function that calls itself, and does not call any other functions
- 53) Consider these statements:
  - i) Any recursive function can be re-written as an equivalent function that doesn't use recursion.
  - ii) Any function that uses loops can be re-written as an equivalent function (or functions) that uses recursion instead of loops.
  - A. i) and ii) are both true
  - B. i) and ii) are both false
  - C. i) is true and ii) is false
  - D. i) is false and ii) is true
- 54) What does this print?

```
def g(n):
    if n <= 0:
        return 0
    else:
        return g(n - 2) + n

print(g(5))

A. 9
B. 10
C. 13
D. 15
E. an int other than 9, 10, 13, or 15</pre>
```

```
def h(n):
    if n == 0:
        return 0
    else:
        return h(n - 1)

print(h(100))

A. 0

B. 1
C. 99
D. 100
E. none of the above
```

## 56) What is pseudocode?

A. the generic name of the language that Python is automatically converted to just before it runs on a real computer

B. the generic name for any programming language, such as Python, that contains English words in it

C. a description of an algorithm/program designed for human reading

D. source code with one or more bugs in it

## 57) Which application is **NOT** a good fit for Python?

- A. data science, e.g. processing and displaying data
- B. machine learning scripting, e.g. processing data and running learning algorithms
- C. high-performance real-time systems, such as airplane control software
- D. back-end web development
- 58) What does this print?

- A. -1
- B. -2
- C. 1
- D. 2

D. the code prints nothing due to an error

# 60) What does this print?

D. the code prints something, but none of the above

E. the code prints nothing due to an error
